

Automated Workflows and Agentic AI: A Prototypical Approach for Data Science Teams

Khang DS, *Member, HCMUS*, Author Two, *Member, HCMUS*,

Abstract—This document serves as a foundational prototype (a scaffolding) for collaborative scientific writing. By leveraging modular $\text{\LaTeX}$ configurations and rigorous Git-based version control, we propose a standardized framework that mitigates merge conflicts and enhances team productivity. **[TODO: Rewrite abstract after the actual topic is finalized.]**

Index Terms—Data Science, Workflow Automation, $\text{\LaTeX}$, Collaboration.

1 Introduction

This is where the journey begins. For our [Scientific Research Method](#) course, establishing a robust workflow is pivotal. We define our initial dataset matrix as $\mathbf{X} \in \mathbb{R}^{n \times p}$, where each instance aims to maximize the expected outcome $\mathbb{E}[X]$.

2 Methodology

[TODO: Khang: Setup the AWS/Neon DB connection details here.] As shown in our prior work, the variance $\text{Var}(X)$ must be minimized. The absolute error is denoted by $|\hat{y} - y|$.

3 Conclusion

A seamless collaboration model significantly reduces technical debt.
